Title : Perspectives of Viticulture Development

Orig Pub : Ayastani koltntesakan, 1956, No 10, 37-40

Abstract : The development of viticulture in the Idzhevanskiy rayon of the Armenian SSR has great prospects. This is due to a relatively mild and warm climate and the presence of quite fertile soils (with humus). The total of yearly precipitation amounts to 430-550 mm, which permits the raising of vineyards not only with the use of irrigation, but also on the "bogara" [non-irrigated soil]. Mild winters with maximum short frosts dropping to -15° permit the vineyards to be left uncovered for the winter. This presents a great advantage, as compared with the Ararat valley, where the vineyards are snowed under during the winter. As shown by the research of the Institute for Viticulture and Wine Production, the vineyards of the Uzuntala village-kolhoz on "bogara" land have yielded the following

crop for 1954 for each single hectare: Lalvar variety 272 c, Matsitoli 165 c, Aligoto 147 c, Saperavi 207 c and Dzhrdzhruk 184 c. The best wildings under prevalent local conditions are Berlandieri x Riparia 5BB and Berlanderia x Riparia 420A, they are drought resistant and even on highly calciferous soils do not suffer from chlorosis.

the First Year of Planting in Relation to the Trimming
of the Young Plant.

Orig Pub : Vinodeliye i vinogradarstvo, SSSR, 1957, No 2, 38-43

Abstract : In order to expedite the formation of bushes, various
methods of trimming the young plants before planting
were studied. The strongest plants were gotten by
leaving 2 or 3 twigs with 2-3 eye buds on each twig on
the seedlings. These also had the greatest root system
development (in number and general growth of the basic
roots and roots of the 1st and 2nd series). This clearly
revealed a correlation between the magnitude of the

ANISOTROPY OF THE MAGNETIC PROPERTIES OF GADOLINIUM

UDC-2004

TOPIC TAGS: anisotropy, magnetization, gadolinium, single crystal, Curie point

ABSTRACT: To determine the influence of magnetic anisotropy on the magnetic phenomena occurring near Curie points, the authors made detailed measurements of the magnetization curves of single-crystalline gadolinium in the temperature range 280-300K. The measurements were made with a Domenicali pendulum magnetometer by a null method in fields up to 15,000 Oe, on rods 5 mm long and 0.2 x 0.4 mm² by a mill method in fields up to 15,000 Oe, on rods 5 mm long and 0.2 x 0.4 mm². The results show that the Curie point value determined by the a and b axes is 280.5 K, while the value determined by the c axis is 290.5 K. The ratio of the magnetization of the c axis to the a and b axes is 1.05. The ratio of the magnetization of the a and b axes is 1.02. The ratio of the magnetization of the a and b axes to the c axis is 0.98. The results have shown that the measurements are in agreement with accuracy of 0.1%.

TITLE: Magnetic properties of gadolinium subjected to high pressure at high temperatures

SOURCE: Zhurnal eksperimental'noy i teoreticheskoy fiziki. Pis'ma v redaktsiyu.
Prilozheniya, v. 1, no. 2, 1965, 8-14

TOPIC TAGS: gadolinium, magnetic property, saturation magnetization, high temperature effect, pressure effect

ABSTRACT: Saturation magnetization, Curie point and temperature dependence of paramagnetic susceptibility were measured in gadolinium to determine the cause for lower saturation magnetization in rhombohedral gadolinium as compared with hexahedral gadolinium. X-ray analysis indicates that most lines on the x-ray pattern for rhombohedral gadolinium correspond to a rhombohedral phase of the samarium type. A few weak lines are due to a phase with double hexagonal (four-layer) packing of the lanthanum type. The weak intensity of these lines indicates that the volume occupied by this phase is small. The experimental data indicate that the rhombohedral

Card 1/2

L 65257-65
ACCESSION NR: AP5014194

7

modification of gadolinium has a lower effective magnetic moment per atom than gadolinium with a hexagonal structure. This may be caused by rearrangement of the electron structure in the 4f layer in gadolinium subjected to high pressure and heating, similar to the rearrangement observed in cerium. The authors are grateful to Yu. S. Senghaas and L. D. Livshits for treating the gadolinium specimens in f.u. to R. S. Lefevre and J. F. J. Verhaegen for taking the x-ray diffraction patterns and to R. G. Levitin for taking photographs of the patterns. 1 figure, 1 table.

TITLE: Magnetostriiction of a gadolinium single crystal

69

SOURCE: Zhurnal eksperimental'noy i teoreticheskoy fiziki, v. 49,
no. 2, 1965, 414-419

B

TOPIC TAGS: gadolinium, magnetostriiction, magnetization, Curie
point, temperature dependence

ABSTRACT: The magnetostriiction of a gadolinium single crystal in
various crystallographic directions was measured as a function of
the magnetic field strength and of the temperature by a tension gauge
method in fields up to 15,000 Oe and in the temperature interval 78
-- 350K. It is found that the paraprocess magnetostriiction is large
not only in the vicinity of the Curie temperature, but at lower tem-
peratures, beginning with 180K. The spontaneous magnetostriiction
caused by the change of exchange energy on passing through the Curie
point was calculated and found to be sharply anisotropic. The curves

Card 1/2

L 5329-66

ACCESSION NR: AP5021101

3

for the temperature variation of the saturation magnetostriction, obtained after subtracting the paraprocess magnetostriction, have a complicated form. Some of these curves have maxima in the temperature interval between 200 and 250K. It is concluded therefore that the behavior of the magnetostriction in gadolinium in this temperature interval cannot be attributed only to processes of rotation of the spontaneous magnetization vector against the magnetic anisotropy forces. Orig. art has: 7 figures, 2 formulas, and 1 table.

AUTHOR: Belov, K.P.; Yergin, Yu.V.ORG: Moscow State University im. M.V.Lomonosov (Moskovskiy gosudarstvennyy universitet)TITLE: Concerning the magnetic structure of gadolinium Report, All-Union Conference on the Physics of Ferro- and Antiferromagnetism held 2-7 July 1965 in Sverdlovsk

SOURCE: AN SSSR, Izvestiya. Seriya fizicheskaya, v. 30, no. 6, 1966, 975-978

TOPIC TAGS: ferromagnetism, antiferromagnetism, rare earth, electric resistance, temperature dependence, gadolinium, MAGNETIC STRUCTURE

ABSTRACT: The temperature and magnetic field dependence of the electrical resistivity of gadolinium crystals has been compared with the corresponding dependences in terbium and dysprosium in order to determine whether gadolinium has a noncollinear magnetic structure at temperatures slightly below the Curie point similar to that detected in terbium, dysprosium, and most rare earth ferromagnets by neutron diffraction experiments (neutron diffraction in the case of gadolinium is difficult to investigate because of the large absorption cross section). The resistivity of gadolinium in the direction of the c axis was found to have a maximum at about 290°K analogous to (but less marked than) the maxima exhibited by the resistivities of terbium and dysprosium at 220°K and 170°K, respectively. The anomalous temperature

Card 1/2

L 07100-67

ACC NR: AP6029112

dependence of the resistivity along the c axis disappeared in a sufficiently strong magnetic field (above 0.3, 1.8, and 15 kOe for Tb, Gd, and Dy, respectively). From this behavior of the resistivity and from the temperature dependence of the galvanomagnetic effect and the magnetostriction of gadolinium reported elsewhere by the authors and others (Zh. eksper. i teor fiz., 47, 860 (1964); 49, 414 (1965) it is concluded that gadolinium has a noncollinear atomic magnetic structure at temperatures above about 210°K. In the absence of accurate neutron diffraction data it is not possible to determine whether this complex structure is of the antiferromagnetic or the ferromagnetic type. The authors thank A.V.Ped'ko for discussing the results.

TITLE: Magnetic anisotropy of a terbium single crystal

SOURCE: Zhurnal eksperimental'noy i teoreticheskoy fiziki, v. 50,
no. 3, 1966, 560-564

TOPIC TAGS: terbium, single crystal, magnetic anisotropy,
ferromagnetism, Curie point

ABSTRACT: Inasmuch as direct measurements of the magnetic anisotropy of terbium in the ferromagnetic range is very difficult, in view of the very strong fields required, the authors show that the size of the magnetic anisotropy energy can be estimated from the magnetization curve of the single-crystal terbium taken in the region of the Curie point. The method used for the purpose is the Landau thermodynamic method, which the authors have used previously to estimate the anisotropy of single-crystal gadolinium. The tested terbium

Card 1/2

27

L 24375-66

ACC NR: AP6010976

single crystal contained less than 0.1% impurities and was oriented by the Laue method. The magnetization measurements were made by a null method with a magnetometer of the Domenicali type in fields up to 15,000 Oe. The paramagnetic susceptibility was measured with the same magnetometer in a field of 10,000 Oe. To eliminate the influence of the magnetocaloric effect, the magnetization measurements were made under isothermal conditions. The temperature variation of the magnetic anisotropy near the temperature of the destruction of the magnetic ordering (near 230K) was estimated from the magnetization isotherms taken along the axis of easy and of difficult magnetization. The anisotropy energy value is found to be very large near the Curie point, of the order of 10^{10} erg/cm³, and depends on the external magnetic field. It is shown that the effective anisotropy field leads to the phenomenon of an 'apparent' lowering of the Curie temperature along the axis of difficult magnetization, by about 30°. This is much higher than previously obtained for gadolinium (1.5°). The authors thank Professor A. S. Borovik-Romanov for discussion of the problem. Orig. art. has: 5 figures and 7 formulas.

TITLE: Oxidation-reduction polymers

SOURCE: Uspokhi khimii, v. 34, no. 12, 1965, 2220-2250

TOPIC TAGS: polymerization, polycondensation, oxidation reduction reaction

ABSTRACT: A review on oxidation-reduction polymers covers three methods of synthesis: 1) polycondensation 2) polymerization, and 3) introduction of active groups into an inert polymer. The various chemical reactions, types of polymers prepared, and their physicochemical properties are discussed. A separate section is devoted to oxidation-reduction exchangers, where methods of preparation, reactions, and physicochemical properties are reviewed. Advantages of inorganic electron exchangers, (e.g., nantronite, sodium polyvanadate, etc.) over oxidation-reduction polymers include the absence of irreversible oxidation reactions, a relatively high oxidation rate, and a high resistance to high temperatures and radiation. Disadvantages are a low capacity and instability in strong acids and strong bases. The various applications of oxidation-reduction polymers are listed. A problem to be solved.

TOPIC TAGS: resin, macroporous resin, resin porosity, oxidation reduction resin, redox resin, resin additive, isoamyl alcohol, oleic acid

ABSTRACT: A modification of a previously described method for the synthesis of oxidation-reduction resins is proposed which yields products with improved water capacity and a higher more controllable porosity. The pores in the product are enlarged by introducing inactive ingredients which are soluble in the primary polymers and are subsequently washed out from the final product. Isoamyl alcohol, oleic acid, methylethyl ketone, $ZnCl_2$, $CaCl_2$, $6H_2O$ or $MnCl_2$ were found to be suitable for the purpose, while immiscible substances such as starch and glucose were not. Water capacity, swelling ability, oxidation-reduction capacity, sodium hydroxide absorption and the kinetics of the oxidation-reduction processes were determined in the products obtained. The effect of the amount of additive on the

Card

About the Projected Program for the Course in Historical and
Dialectical Materialism (O proyekte programmy kursa dialektichesko-
go i istoricheskogo materializma)

PERIODICAL: Vestnik Vysshey Shkoly, 1957, May, p 21-25 (USSR)

ABSTRACT:

The author states that Professor F.F. Yenevich indicates the proper direction of the program of courses relating to dialectical and historical materialism. On the other hand the author proposes alterations in the program. He states that it is necessary to explain immediately after the introductory lecture the elementary question of philosophy on the basis of an analysis of the historical development of philosophy "How Does a Philosophy Start?" As a rule, prior to Marx, philosophy started with the research of unchangeable substances of things, the absolute initial origin of the world. Idealistic philosophy, however, starts with the research of absolute knowledge, absolute mind (spirit), etc. After having explained in the first general part of the program, the determination of the initial conception of philosophy relating to the beginning of

Card 1/3

Card 2/3

the development of the relations between man and the environment and between man and the dependence of these relations on the development of productive forces has to be shown. The development of notion and categories of men on the basis in specific explanation of general dialectics must show a systematic exposition of these two conflicts.

3-5-6/38

About the Projected Program for the Course in Historical and Dialectical Materialism

the basis of practical life shall also be demonstrated. The fourth part of the program comprises the explanation of relations between dialectical materialism and natural science. It is necessary to show the conflict of the fundamental trends in natural science. The following questions have to be dealt with: the concept of matter, space and time, our concept of the theory of relativity, relation to quantum theory, classification of science, questions of overcoming the crisis in physics, etc.

SOURCE: Aviatsiya i kosmonavtika, no. 1, 1966, 21-24 communication

ABSTRACT: The Soviet Molniya satellites are capable of extending TV (including color), radio, telephone, and phototelegraphic communications to the countries of the northern hemisphere, covering such countries as the USSR, US, Cuba, Japan, and the countries of Southeast Asia. Such a worldwide communications system could be set up by an international communications system within the framework of the United Nations, as was proposed by Academician A. A. Blagonravov on 4 November 1964 at the 32nd session of the United Nations Committee on Space. This communications system would cut such costs as building cable lines, telephone centers, radio stations, and transmitters. [WII]

TITLE: Metal Pressure on the Piercing Mill Rolls

PERIODICAL: Izvestiya vysshikh uchebnykh zavedeniy. Chernaya metallurgiya, 1960, Nr 7, pp 103-110

TEXT: An experimental investigation at Nikopol'skiy Yuzhnortrubnyy zavod (Nikopol' Tube Works) is described. The purpose was to study the dynamics of the process, which is important for full utilization of the power and mechanical strength of rolling mills, as well as for establishing an optimum rolling process technology. The "400" installation of the plant used for experiments consists of two continuous heating furnaces; two piercing mills (with 960-860 mm diameter rolls and 2,350 kw motor); one reheating furnace before the spreading mill; an automatic spreading mill; two rolling-over mills; one sizing mill, and a cooler with a straightening machine. Both piercing mills are operating only when rolling large-diameter and thin-walled tubes; otherwise the piercing mill Nr 2 operates alone. It produces billets in a single piercing. Metal pressure on the

Card 1/3

Metal Pressure on the Piercing Mill Rolls

S/148/60/000/007/005/015
A161/A029

piercing mill rolls was measured with dynamometers placed between the screwdowns and the work roll bolster (Figure 1), in especially prepared casings (Figure 2). Pressure oscillograms are shown (Figure 3) and "decoded" (in Table 1). No sufficiently accurate theoretical or experimental data are yet available on the dependance of specific metal pressure on the basic piercing process parameters, and data obtained by experience are usually being employed in calculations of the piercing mill parts and technology. In the described investigation, mean pressure was determined by dividing the experimentally determined full metal pressure on the rolls by the contact area between the metal and the rolls:

$$p = \frac{P}{s} \text{ kg/mm}^2.$$

A.I. Tselikov's method /Ref 3/ was used for determining the contact area, taking into account the ovality of the billet. The mean specific pressures are given in a table (Table 2). It was stated that for alloy steel the mean specific pressure is $10-14 \text{ kg/mm}^2$, and for carbon steel it reaches $7.5-12 \text{ kg/mm}^2$, which matches the data obtained in other investigations /Refs 1, 4 and 5/. The following conclusions were drawn: 1) In the two piercing mills studied the pressure was 33-92 ton, which is not high for this type of mills. In rolling

Card 2/3

Metal Pressure on the Piercing Mill Rolls

8/148/60/000/007/005/015
A161/A029

stainless and alloy steel the pressure is higher than in rolling carbon steel, provided that axial slip has no dominating effect as is the case in rolling 168x8 mm tubes of X 5BФ (Kh5VF) and 168x10 mm tubes of X 5 (Kh5) steel tubes. When rolling tubes of equal diameter but different wall thickness, the pressure curve has a maximum. 2) The pressure on the inlet side screwdown is higher than on the outlet side screwdown: by 2-3 times in the piercing mill Nr 1, and 2-4 times in the Nr 2. Load on the outlet side bearings being much lower, their rated life time may be increased 2-3 times. 3) Only slip (lag) of metal was observed in the deformation zone, lead was absent. The axial slip coefficient was between 0.48 and 0.90. There are 8 figures and 5 Soviet references.

TITLE: Diurnal rate of the albedo and the penetration of solar radiation into sea water

SOURCE: AN SSSR. Izvestiya. Fizika atmosfery i okeana, v. 1, no. 11, 1965, 1216-1219

TOPIC TAGS: albedo, solar radiation, thermoelectric pyranometer, total radiation

ABSTRACT: The albedo and the solar radiation which penetrated into the Black Sea have been investigated in July and August 1964, using the research vessel "Moskovskiy universitet". Measurements were made with thermoelectric pyranometers suspended on gimbals six meters from the vessel and three meters above the water's surface. The total radiation increases rapidly from $0.2 \text{ cal/cm}^2\text{min}$ when the height of the sun is 10° to $1.4 \text{ cal/cm}^2\text{min}$ with the height at 60° . The reflected radiation amounts to about $0.07 \text{ cal/cm}^2\text{min}$ and changes slightly when the height of the sun is more than 20° . The albedo of the surface of the sea caused by the total radiation under a cloudless sky is determined by an empirical formula, which is represented graphically in the original article. A special formula is given for the total incident solar radiation

PERIODICAL: Gidrotekhnicheskoye Stroitel'stvo, 1958, Nr 5, p 50 (USSR)

ABSTRACT: The filling of seams with a cement solution is labor consuming work, as it must be carried out at considerable heights and only during warm weather. To decrease the labor costs and to improve the quality, a new method has been proposed. At the Kuybyshev Hydroelectric Power Plant the seams are filled with concrete while cementing the blocks, instead of filling the seams manually. As a result, expenses for the filling of seams have been lowered considerably.

betonnymi balkami na Stalingradskoy GES)

PERIODICAL: Gidrotekhnicheskoye stroitel'stvo, 1958, Nr 8, pp 9-11 (USSR)

ABSTRACT: Ordinary precast reinforced concrete beams were used on
the Stalingrad Hydroelectric Power Plant as a covering for the
suction pipes. This method is compared with the method used
on the Kuybyshev GES, which consisted in covering the suction
pipes with plate-sheathings with the help of metallic trestles.
Both methods are described in detail. It was found that the
method of covering with prefabricated beams was much more
economical and required less manual work.
There are 6 diagrams and 1 table.

TITLE: New Photoelectric Spectroscopical Apparatus

PERIODICAL: Izvestiya Akademii nauk SSSR. Seriya fizicheskaya, 1959,
Vol 23, Nr 9, pp 1105 - 1107 (USSR)

ABSTRACT: In the present paper the apparatus of the types FESA-4 and
FESA-4M are described. The former consists of an arc generator
of the type DG-2, a three-lens condenser system, the optical
part of the spectrograph of the type ISP-52, the camera of the
type UF-84, the collimator of the type UF-61 and a system for
line separation with four outlet slits and four photoelectric
cells of the type STsV-4. The instrument is automatized and has
an error of less than 0.5%. A photograph of this apparatus is
shown by figure 1. The second apparatus described here consists
of four blocks, and differs from the first by the optical system
and by the form of its construction (Fig 2). The instrument makes
it possible to control the line intensities. The experiments
carried out by means of both apparatus with two different
materials are shown by two tables. There are 2 figures, 2 tables,

TITLE: Insecticidal properties of the various forms of DDVP and perspectives of
their application for disinfection

SOURCE: Zhurnal mikrobiologii, epidemiologii, i immunobiologii, no. 7, 1966, 24-29

TOPIC TAGS: insecticide, aerosol, DDVP, insect pest

ABSTRACT: Preparations of DDVP (O,O-dimethyl O-2,2-dichlorvinyl phosphate) can be used for the immediate extermination of flies and domestic insects (bugs, cockroaches, fleas), in the form of 0.5-0.3% aqueous solutions. A minimal amount, assuring 100% destruction of flies, fleas, and bugs on finished surfaces (glass, wood) is 0.05-0.5 g, for cockroaches 1-2 g per 1 m² (see Tables 1 and 2). Residual action at 18-20° lasts no longer than 5-7 days. To exterminate fly larvae in their substrate, a 0.2%-0.5% aqueous solution can be used at a standard flow rate of the pressure fluid (1-2 liters of solution for materials up to 30 cm thick. Bait for flies and cockroaches can be prepared from aqueous

solutions of DDVP. However, the short period (2 days) of residual action of such bait limits prospects for use in practice. DDVP dusts can be used to exterminate a number of domestic parasites. However, in view of the brief period of residual action, further study of the prospects for use in extermination practice is necessary. DDVP is toxic to animals when taken internally. (LD_{50} of various samples of preparation is 100–200 mg/kg for mice.) Inhalation of a 0.5% aqueous solution during single or repeated spraying, does not induce any toxic effect in various animals. In preparing aqueous solutions and other forms of DDVP, precautionary measures must be observed, in view of the possibility of entry of the concentrated preparation into the mouth and skin. DDVP in aerosol or vapor form is especially promising.

Title : The Interhybrid Crossing of Tomatoes. (Vnutrigibridnyye skreshchivaniya pomidorov).

Orig Pub: Vestn. s.-kh. nauki, 1957, No 2, 46-52.

Abstract: In F_2 and F_3 of intervarietal hybrids of tomatoes, crosses were made with the hybrid plants obtained from the very same combination of varieties although grown on different agricultural grounds. Among the hybrids obtained, individual and individual-group selection was applied. Owing to these methods the productivity of the hybrid descendants was successfully increased by 15-30% in comparison with the
